

LogoTrace Software Installation Quick Start Guide

v1.5 August 1, 2009

Installing the Software

For the Beta 2 release of LogoTrace, 31Hex requires you to do a few processes manually. With the final released version, these processes will happen automatically when installing the software.

Step 1 UnZip the Software

- Unzip the files into a directory of your choosing.
- Due to some Virus Protection Software, all executables have been renamed to “.xex”. Please rename the files with an “.xex” extension to “.exe”.

Step 2 Copy the DLL

- Copy the “LogoTraceBeta.DLL” file to the “C:\Windows\System32” directory.

NOTE: If you have installed the first Beta version of LogoTrace, please copy over the old file with this new version.

Step 3 Install the HASP Run-Time Environment

- Open a DOS Window
- Navigate to the directory where you UnZipped all of the files.
- Type the following at the DOS Prompt:

```
haspdinst -i
```

- The HASP Software Protection Run-Time Environment will install on your PC.

Step 4 Install the LogoTrace Demonstrator Software

- Open “My Computer” and navigate to the directory where you UnZipped all of the files.
- Double-click on “Setup.exe”
- The LogoTrace Demonstrator will install.
- If you do not have the Microsoft .NET framework installed on your PC, you will need to go to Microsoft’s website and install the .NET Framework.

Step 5 Demonstration Software is Ready to Use

- Make sure you read the LogoTrace Demonstrator documentation to begin testing a sample image.
- Make sure you read the 31HexAppDemo documentation prior to embedding LogoTrace into your application.
